

Should we keep spending?

July 2024 - June 2026 | Based on completed orders

THE ANSWER

Keep marketing - but do not increase the total budget yet.

Shift spending carefully and test which campaigns bring extra sales.

€407,500

Campaign budgets

€569,493

Sales credited to campaigns

–€290,755

After product costs + budgets

For every €1 budgeted, campaigns received credit for about €1.40 in sales. But after estimated product costs, those credited sales did not cover the campaign budgets.

What matters most

1 Big campaigns deserve review.

Summer Mega Sale had a €185,000 budget but only €124,823 in credited completed sales. Both Black Friday Google Ads campaigns also showed weak results.

2 Summer Mega Sale also brought first-time buyers.

452 of its 577 credited completed orders were customers' first observed purchases. These customers might buy again - but we have not measured whether they repay the cost.

3 Smaller campaigns look more promising.

Loyalty Points x2 and the newsletter campaigns covered their budgets in the estimated product-contribution calculation. Many orders came from existing customers, though.

What to do next

• Review large spends:

Do not repeat Summer Mega Sale or the Black Friday budgets at the same scale without stronger evidence.

• Keep small, measured trials:

Continue limited loyalty and newsletter tests while checking if they create additional purchases.

• Run a fair experiment:

Hold out a random comparable customer group from a campaign and compare sales after product costs.

WHAT THE NUMBERS CANNOT PROVE

A sale credited to a campaign is not necessarily a sale caused by it. The €290,755 figure is an estimated accounting shortfall, not a proven loss caused by marketing. Budgets are treated as spending; some order values have data-quality issues.
